The James Cook University Hospital, Middlesbrough, United Kingdom

[The James Cook University Hospital](#) is a district general hospital for around 300,000 people living in Middlesbrough and the local authority area of Redcar and Cleveland. The James Cook University Hospital merged with the Friarage Hospital, Northallerton, in April 2002. The Friarage Hospital provides a district general hospital service for a population of 122,000, stretching from the North Yorkshire Moors to the Central Pennines, the borders of York District in the South, and the borders of Darlington in the North. The 7,000-strong workforce provides a range of highly specialist services extending to 1.5 million people in Teesside and parts of Cumbria, Durham, and North Yorkshire.

These services include treating heart disease, cancer, renal services, neurology, and neurosurgery. The newest of these services is the North of England Spinal Injuries Centre. We are also a cancer centre and a cancer unit for the common cancers and the focus for the Cancer Care Alliance of Teesside, South Durham, and North Yorkshire

The James Cook University Hospital contacted EndoSoft to present the possibilities of EndoSoft within the new Endoscopy facility. The main goal was an easy to use, flexible and stable database and image management tool which provided all features for audit trail and which could interface through ODBC with their existing PAS system as well as through HL7 with the new Hospital Information System. As EndoSoft has experience with both interfaces for many years, EndoSoft implemented a full system which enables them to import all scheduled procedures and Referring physicians through an easy to use ODBC interface. The EndoWeb browser application enables all authorized users to view and print all procedures, reports and images throughout the hospital's Local Area Network.
